INTRODUCTION

This symbol indicates an important personal safety warning. Failure to comply with the warning may result in very high risks for exposed personnel.

The JANUS safety light curtain is a multi-beam opto-electronic safety system of the Type 4 category of electro-sensitive devices (in accordance with IEC 61496-1,2; EN 61496-1) – if necessary equipped with MUTING function (“M” models) - for the protection of persons exposed to dangerous machines or plants.

The two PNP auto-controlled static outputs permit connection of the light curtain to a control system complying with the requirements and level of safety required for the application.

The light curtain integrates the start/restart interlock and EDM functions (control of external relays K1 and K2). In this way, the light curtain can be connected to a simple pair of relays or external safety contactors without having to install additional modules.

A diagnostic display on the Emitter and Receiver provide the information required for correct use of the device and to check for any operating faults.

The diagnostic output (see TROUBLESHOOTING, page 40) makes it possible to obtain weak signal and light curtain status information from a single wire.

JANUS is ideal for protecting:

- automatic palletizing/depalletizing systems
- materials handling and storage systems;
- packing and packaging machines;
- assembly lines;
- industrial automatic warehouses;
- AGV transit openings;
- metal, wood, marble and glass tool machines;
- presses, die cutting machines.

For problems regarding safety, if necessary, consult the competent safety authorities of your country or the related industrial association.

For applications in the food industry, consult the manufacturer to check compatibility between the materials of the light curtain and the chemical agents used.

The guarding function of opto-electronic safety devices is not effective in the case in which the machine cannot be electrically controlled and is unable to stop the dangerous movement immediately at any time during the work cycle.

PRINCIPLE OF OPERATION

LIGHT CURTAIN

If the area guarded is clear, the two outputs on the Receiver are active and permit normal functioning of the machine connected to these.

When an object larger than or equal to the resolution of the system interrupts the sensing field of one or more beams, the Receiver de-activates its outputs.

This condition makes it possible to block the dangerous movement of the machine (using a suitable machine stop circuit).

Resolution is the smallest diameter object that will be reliably detected by at least one of the optical beams generated by the light curtain (Figure 1).

Figure 1- Light curtain resolution

Resolution is constant regardless of working conditions as it depends only on the geometrical characteristics of the lenses and the center distance between two adjacent lenses. The height of the guarded area is the height effectively protected by the safety light curtain.

If the curtain is positioned horizontally, this value indicates the depth of the guarded zone. The useful range is the maximum operating distance that can exist between the Emitter and Receiver.

JANUS is available with the following resolutions (MODEL "MI") :

- 30mm (protected heights from 300mm to 1200mm) ("**MI**" models):
PROTECTION OF THE HANDS.
- 40mm (protected heights from 300mm to 1800mm) ("**MI**", "**MILR**" and "**JLR**" models):
PROTECTION OF THE HANDS.
- 90mm (protected heights from 300mm to 1800mm) ("**MI**" models):
PROTECTION OF THE LIMBS.

JANUS is also available in a **Multibeam** version ("**MI**", "**MT**" and "**ML**" models) with a pitch between the lenses of:

- 500mm (2 beams), 400mm (3 beams), 300mm (4 beams only models "**MI**"), "**MILR**" "**J**" and "**JLR**". **PROTECTION OF THE BODY.**

MUTING FUNCTION

The Muting function is a temporary suspension of the safety light curtain's protective function. Carefully check your risk analysis in order to assess whether the Muting function is compatible with your application and what additional measures have to be taken.

The Muting function generates a **temporary, automatic interruption of safety light curtain functioning** in order to permit normal transit of material through the guarded opening.

The Muting function is activated when the system detects the object that interrupts the opening protected. In other words, when the system recognizes the material and distinguishes between this and any operator (in a potentially dangerous situation), it is enabled to bypass the light curtain temporarily, allowing the material to pass through the opening.

The Muting sensors – which can be integrated in the light curtain (**models "ML" and "MT"**) or be external (**model "MI"**) – form the sensing system that decides whether the Muting function is to be activated (or not). Control of the dangerous opening can be de-activated only by a correct sequence of interruption of the beams of the Muting sensors.

The JANUS system is available in the "ML" and "MT" models (with 2 integrated opto-electronic sensors) and "MI" models to which 2 or 4 sensors of various type can be connected (proximity, optical, capacitive etc).

SERIES "ML" - PREASSEMBLED KIT OF JANUS LIGHT CURTAIN AND SENSOR ELEMENT "ML S" **Integrated Muting sensors – only for one-way openings with pallet exit.**

In this model, the sensors 1 and 2 are on the same side of the vertical light curtain and are placed in front of the guarded opening (Figure 2).

This model is one-way and is useful for protecting pallet exit openings.

The Muting function is activated following concurrent interruption (within max. 4 sec) of sensors S1 and S2. The Muting function remains active as long as both sensors remain occupied.

When the first of the 2 sensors is cleared, the material has four seconds to abandon the guarded area delimited by the light curtain. The Muting condition will be disabled as soon as the protected area is cleared.

After 4 seconds, if the light curtain is still occupied, the OSSD outputs are disabled, interrupting functioning of the machine. For this model, the maximum duration of the Muting condition (timeout) can be set to 30 seconds or 90 minutes.

Figure 2

To guarantee the safety operation of the ML series, the horizontal muting sensor must be mounted *INSIDE* the dangerous area (dashed on Figure 2).

When using a ML series JANUS, the minimum distance between two consecutive pallet must be less than 10cm or more than 32cm.

SERIES "MT" - KIT PREASSEMBLED OF JANUS LIGHT CURTAIN AND SENSORS ELEMENTS "MT S1" and "MT SE"

Integrated Muting sensors – for two-way openings with pallet entrance/exit.

In this model, the Muting sensors are the first on one side and the second on the other in relation to the vertical light curtain (Figure 3).

This model is therefore two-way and is useful for protecting pallet entrance/exit openings.

The point of intersection of the two muting sensors (Figure 11) must be inside the dangerous area in order to avoid accidental actuation of the Muting function.

The Muting function is activated following concurrent interruption (within max. 4 sec) of sensors S1 and S2. The Muting function remains active as long as both sensors remain occupied.

When the first of the two sensors is cleared, the Muting function is disabled.

Also for this model, the maximum duration of the Muting condition (timeout) can be set to 30 seconds or 90 minutes.

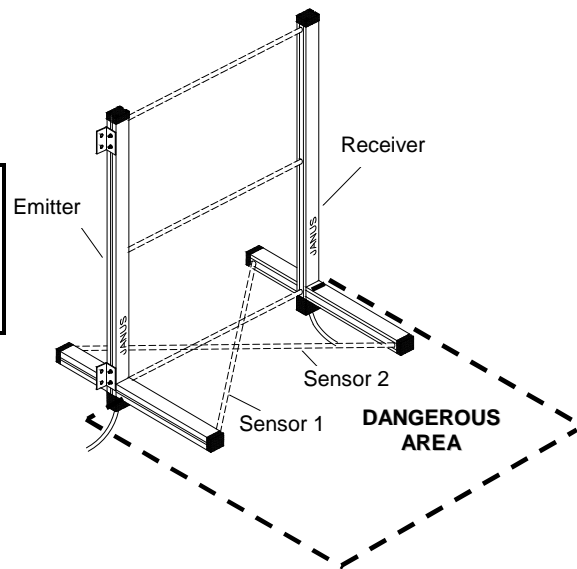

Figure 3

SERIES "MT S4" - KIT PREASSEMBLED OF JANUS LIGHT CURTAIN AND SENSORS ELEMENTS "MT S"

Integrated Muting sensors – for two-way openings with pallet entrance/exit.

This model is two-way and is useful for protecting pallet entrance/exit openings (Figure 4).

Using this model, two methods of operation are possible:

Concurrent

The Muting function is activated following concurrent interruption of sensors S1 and S2 (within maximum 4sec) (or S4 and S3 with material transiting in the opposite direction). **Muting status ends after clearing of the opening and of S3 (or S2 with material transiting in the opposite direction).**

Sequential

The Muting function is activated following sequential interruption of sensors S1 and S2, of the opening and of sensors S3 and S4. **It is important to remember that, for correct actuation of the Muting function, the sequence indicated in Figure 8 and Table 1 is required (without time restrictions).**

Figure 4

- The MT S4 models have two available timeouts: 1) 30 sec; 2) infinite (Sequential operation).
- The pallet minimum length (in both operation modes) must be 70cm (all the 4 sensors have to be simultaneously occupied).

SERIES "ML S2" - KIT PREASSEMBLED OF JANUS LIGHT CURTAIN AND SENSORS ELEMENTS "ML S"
Integrated Muting sensors – for one-way openings with pallet exit.

In this model, the sensors 1 and 2 are on the same side of the vertical light curtain and are placed in front of the guarded opening (Figure 5).

This model is one-way and is useful for protecting pallet exit openings.

The Muting function is activated following concurrent interruption (within max. 4 sec) of sensors S1 and S2. The Muting function remains active as long as both sensors remain occupied.

When the first of the 2 sensors is cleared, the material has four seconds to abandon the guarded area delimited by the light curtain. The Muting condition will be disabled as soon as the protected area is cleared.

After 4 seconds, if the light curtain is still occupied, the OSSD outputs are disabled, interrupting functioning of the machine. For this model, the maximum duration of the Muting condition (timeout) can be set to 30 seconds or 90 minutes.

Figure 5

To guarantee the safety operation of the ML S2 series, the horizontal muting sensor must be mounted INSIDE the dangerous area (dashed in Figure 5).

When using a ML series JANUS, the minimum distance between two consecutive pallet must be 40cm.

MODEL "MI" – external sensors
3 selectable methods of Muting.

The "MI" model can use 2 or 4 sensors that must be connected to the M12 connectors on the front part of the vertical light curtain. These sensors may be of various types (proximity, optical, capacitive with PNP or electromechanical type output and with DARK-ON switching (i.e. output active when material is present). If 4 sensors are connected, it is possible to choose two methods of operation: **1) Concurrent; 2) Sequential.**

CONNECTION WITH 2 EXTERNAL SENSORS (Figure 6)

This model is two-way and is useful for protecting pallet entrance/exit openings.

The point of intersection of the two sensors must be located inside the dangerous area to prevent accidental and dangerous activation of the Muting function.

The Muting function is activated following concurrent interruption (within max. 4s) of sensors S1 and S2. The Muting function continues as long as both sensors are occupied. When the first of the two sensors is cleared, the Muting function is disabled.

Also for this model, the maximum duration of the Muting condition (timeout) can be set to 30 seconds or 90 minutes.

Figure 6

CONNECTION WITH 4 EXTERNAL SENSORS

Using 4 sensors, two methods of operation are possible:

Sequential (figure 7)

The Muting function is activated following sequential interruption of sensors S1 and S2 and of sensors S3 and S4. **It is important to remember that, for correct actuation of the Muting function, the sequence indicated in Figure 8 and Table 1 is required (without time restrictions).**

It is also possible to enable a control of the activation time of the 4 sensors.

Concurrent

The Muting function is activated following concurrent interruption of sensors S1 and S2 (within maximum 4sec) (or S4 and S3 with material transiting in the opposite direction).

Muting status ends after clearing of the opening and of S3 (or S2 with material transiting in the opposite direction).

Figure 7

➔ The MI models connected with 4 external sensors, have two available timeouts:
1) 30 sec; 2) infinite.

Figure 8

Sequential muting: activation sequence.

1	1	1	0	MUTING
1	1	1	1	MUTING
0	1	1	1	MUTING
0	0	1	1	MUTING
0	0	0	1	LIGHT CURTAIN ACTIVE
0	0	0	0	LIGHT CURTAIN ACTIVE

Table 1

LEGEND:

0 = SENSOR FREE; 1 = SENSOR ENGAGED

Both operating modes with 4 sensors are TWO-WAY.

The correct Muting sequence can start either from sensor 1 or from sensor 4.

MI MODELS USED WITH "L" OPERATIONAL LOGIC

In this model the sensors 1 and 2 are on the same side with respect to the vertical curtain and are positioned in front of the dangerous opening (Figure 9 and Figure 10). This model is unidirectional and is useful for protecting openings with pallet exit.

The activation of the Muting function takes place following the simultaneous interruption (within max. 4 sec) of sensors S1 and S2. The Muting function remains while both sensors are occupied.

On release of the first of the 2 sensors, the material will still have 4 seconds available to abandon the protected area delimited by the curtain. The Muting condition will be disabled as soon as the protected area is released.

If the curtain is still occupied after the 4 seconds, the OSSD outputs are disabled, interrupting machine functioning.

For this model, the maximum duration of the Muting condition (timeout) can be selected in 30 seconds or 90 minutes (Table 13).

It is indispensable that a Muting sequence is completed (release of controlled area) in order to guarantee the correct activation of the successive sequence.

For safe functioning of the MI series (with L logic), it is necessary that the muting sensors are positioned inside the dangerous area (traced in Figure 9 and Figure 10).

Figure 9 - Crossed sensors

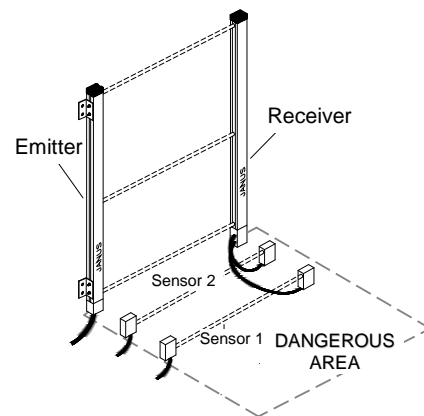

Figure 10 - Parallel sensors

INSTALLATION

Before installing the JANUS safety system, check that:

The safety system is used only as stopping device and not as machine control device.

The machine can be controlled electrically.

Any dangerous action of the machine can be promptly interrupted. In particular, the stopping time of the machine must be known, if necessary measure this.

The machine must not cause dangerous situations due to flying or dropping of material; otherwise, additional mechanical guards are required.

The minimum size of the object that must be detected must be greater than or equal to the resolution of the model selected.

Knowing the shape and dimensions of the dangerous area, it is possible to assess the width and height of its access area:

Compare these dimensions with the maximum useful range and the height of the area protected of the model used.

Before positioning the safety device, take into account the following general indications:

Check that the temperature of the environments where the system is installed is compatible with the temperature operating parameters indicated in the technical data.

Do not position the Emitter and Receiver close to sources of bright light or high intensity flashing lights.

Particular environmental conditions may impair the detection efficiency of light curtains. In places with the possibility of mist, rain, fumes or dust, for correct functioning of the equipment it is advisable to apply suitable correction factors F_c to the values of useful operating range.

In these cases:

$$Pu = Pm \times Fc$$

where Pu and Pm are respectively the useful and maximum operating range in meters.

The recommended F_c factors are indicated in the table below.

ENVIRONMENTAL CONDITION	CORRECTION FACTOR F_c
Mist	0,25
Vapors	0,50
Dust	0,50
Dense fumes	0,25

Table 2

If the device is installed in areas liable to sudden changes in temperature, suitable measures must be taken in order to avoid formation of condensation on the lenses which could impair detection efficiency.

If JANUS light curtains are used with palletizers, depalletizers and stacking/destacking machines for empty pallets, refer to European standard EN 415-4.

POSITIONING

Protection of the guarded opening by JANUS must be integrated with suitable mechanical guards.

While the "MI" model permits various types of installation (2, 4 sensors, one- or two-way), the "ML" and "MT" have been designed for "dedicated" use.

- In particular, "ML" manages the muting function in **one-way** mode (normally for pallet exit); in this case, the horizontal arms must be positioned between the dangerous area and the light curtain.
- The "MT" model manages the muting function in **two-way** mode using four horizontal arms. This model is useful when the pallets, once the process has been carried out by the dangerous machine, must be returned outside using the same palletizer.

POSITIONING OF THE MUTING SENSORS ("MI" SERIES).

2 sensors

The Emitter and receiver of the light curtain must be positioned so as to permit access to the dangerous area from above, from below and from the sides without first of all intercepting at least one of the optical beams.

Indications for correct positioning of the light curtain are provided in the figure below.

Figure 11

For correct positioning of sensors 1 and 2, i.e. those that manage enabling and disabling of the Muting function, take into account the following:

- the two beams must be crossed and pass diagonally through the zone guarded by the light curtain;
- the point of intersection of the two beams must be **in the dangerous area beyond the light curtain**;
- the angle between the two Muting beams must be calculated according to the size of the pallet and its speed, taking into account that the Muting function is activated only if the interception delay between the two sensors is less than 4 seconds;
- the pallet must interrupt the two beams **before** intercepting the light curtain;
- the two beams must be interrupted continuously by the pallet for the entire period during which the pallet passes between the sensors;
- make sure that the two beams are effectively intercepted by the material on the pallet and not by the empty pallet;
- the zone identified by the points of interception and clearing of the beams of sensors 1 and 2 by pallet **must be limited as far as possible (or suitably protected)** so as

to avoid the possibility of accidental passing through the light curtain with Muting active (Figure 12).

Figure 12

4 sensors

For correct positioning of sensors 1, 2, 3 and 4, i.e. those that manage enabling and disabling of the Muting function, take into account the following:

Figure 13

SEQUENTIAL (Figure 8, Figure 13 Table 1):

- the distance between the first and the last sensor must never exceed the length of the pallet (**in one of the phases of the sequence, the 4 sensors must all be intercepted simultaneously**);
- the pallet must interrupt sensors S1 and S2 (or S4 and S3 in the opposite direction) **before** intercepting the light curtain;
- make sure that the two beams are intercepted by the material on the pallet and not by the empty pallet

Figure 14

CONCURRENT (Figure 14):

- The Muting function is activated following concurrent interruption (**within max. 4 sec**) of sensors S1 and S2 (or S4 and S3 in the opposite direction).
- also in this operating mode, for correct activation of the Muting function, **for a short period of time, all 4 sensors must be intercepted simultaneously**.

POSITIONING AND ADJUSTMENT OF SENSOR ELEMENTS FOR "ML" AND "MT" SERIES:

As already mentioned, the pre-assembled JANUS "ML" and "MT" kit consist of a vertical light curtain and of **one ("ML" series)** or **two ("MT" series)** horizontal sensor element in which the Muting sensors are integrated.

The system is equipped with a VERTICAL adjustment of the sensor elements to solve the following problems:

- Incorrect and non-continuous sensor beam interception by the material in movement.
- Need to reduce the beam intensity when transparent objects (i.e. glass, plastic, etc) are detected.

At the operating range limits (1 ÷ 2,5m) or in dusty environments, it would be necessary to use the ANGULAR adjustment to reach the maximum signal intensity. (REER advise against this operation with transparent materials).

Figure 15 shows the two axes (horizontal and vertical) on which to operate.

To make the adjustment:

- loosen the Allen screws;
- operate on the arms to make the adjustments;
- tighten the Allen screws.

Figure 15

NOTE: For installations that do not require any particular adjustments, the ML and MT models are pre-aligned and do not require further regulation.

CALCULATION OF THE SAFETY DISTANCE

The light curtain must be positioned at a distance exceeding or equal to the **minimum safety distance S** so that a dangerous point can be reached only after stopping the dangerous action of the machine (Figure 16).

Referring to European standard EN999, the minimum safety distance **S** must be calculated according to the following formula:

$$S = K (t_1 + t_2) + C$$

where:

S	minimum safety distance	mm
K	speed of approach of the body to the danger area.	mm/sec
t₁	total response time in seconds of the safety light curtain	sec
t₂	response time of the machine in seconds, i.e. the time taken by the machine to interrupt the dangerous action from the moment in which the stop signal is transmitted	sec
C	additional distance	mm

Failure to comply with the safety distance reduces or defeats the protective function of the light curtain.

If the position of the light curtain does not exclude the possibility of the operator accessing the danger area without being detected, the system must be equipped with additional mechanical guards.

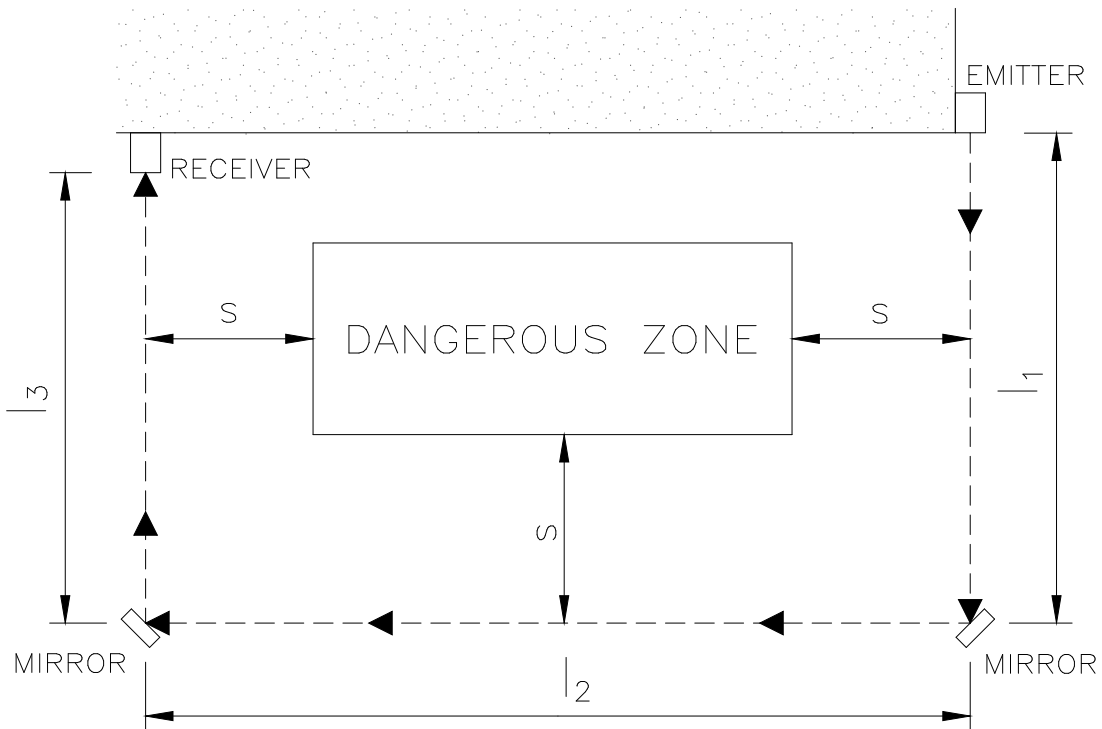

Figure 16

VERTICAL POSITIONING OF THE LIGHT CURTAIN

Models with resolution 30, 40mm.

These models are suitable for detecting the hands

The minimum safety distance **S** is calculated according to the following formula:

$$S = 2000 (t_1 + t_2) + 8(D-14)$$

(D=resolution)

This formula is valid for distances **S** between 100 and 500 mm. If, according to the calculation, **S** exceeds 500 mm, the distance can be reduced up to a minimum of 500 mm using the following formula:

$$S = 1600 (t_1 + t_2) + 8 (D-14)$$

Where, due to the particular configuration of the machine, it is possible to access the danger area from above, the highest beam of the light curtain must be at a height **H** of at least 1800 mm from the resting surface **G** of the machine.

Figure 17

Models with resolution 90mm.

These models are suitable for detecting the arm or legs and must not be used to detect the fingers or hands.

The minimum safety distance **S** is calculated according to the following formula:

$$S = 1600 (t_1 + t_2) + 850$$

➔ In any case, the height **H** of the highest beam from the reference surface **G** must not be less than 900 mm while the height of the lowest beam **P** must not exceed 300 mm.

Figure 18

Multibeam Models

These models are suitable only for detection of the entire body.

The minimum safety distance **S** is calculated according to the following formula:

$$S = 1600 (t_1 + t_2) + 850$$

➔ The recommended height **H** from the reference surface **G** (ground) is as follows:

Figure 19

MODEL	BEAMS	Recommended height H (mm)
2B	2	400 – 900
3B	3	300 – 700 – 1100
4B	4	300 – 600 – 900 - 1200

For applications on packaging machines (palletizers and depalletizers), comply with the indications of European standard EN 415-4, which are repeated below.

Dimensions in m

Type of access

From low level (floor)
Device with minimum 3 beams

Above the conveyor (roller bed)
Device with minimum 2 beams

Figure 20

Protection of the opening with JANUS light curtain and mechanical side guards.

MULTIPLE SYSTEMS

When several JANUS systems are used, these must not interfere optically with each other. Position the elements so that the beam emitted by the Emitter of a system is received only by the respective Receiver.

Figure 21 provides various examples of correct positioning of two photo-electric systems. Incorrect positioning could generate interference and possibly result in irregular functioning.

Side by side systems: A
Adjacent positioning of the two projectors

Systems one above the other: B

Figure 21

DISTANCE FROM REFLECTIVE SURFACES

The presence of reflective surfaces close to the light curtain may cause spurious reflections that prevent detection. Referring to Figure 22, object **A** is not detected because of surface **S** which, reflecting the beam, closes the sensing field between the Emitter and Receiver. A minimum distance d must therefore be maintained between any reflective surfaces and the protected area. The minimum distance d must be calculated according to the distance l between Emitter and Receiver and taking into account that the angle of projection and reception is equal to 4° .

Figure 22

Figure 23 indicates the values of the minimum distance d to be complied with as the distance l between Emitter and Receiver varies.

JANUS

JANUS Long Range

Figure 23

After installation, check for any reflective surfaces, intercepting the beams first of all at the center and those close to the Emitter and Receiver.

During this procedure, the red led on the Receiver must never switch off.

LIGHT SIGNALS

EMITTER SIGNALS

At power-on, all the leds are ON for a period of 5 seconds. Subsequently, the leds display functioning condition.

Figure 24

LED	MEANING NORMAL FUNCTIONING (LED ON)	COLOR
Test	Light curtain under test	YELLOW
	Light curtain functioning	GREEN
	Fault detected	RED
	High range selected *	ORANGE

Table 3

If a fault is detected, the led will indicate the type of alarm (ref. "TROUBLESHOOTING").

* The value of the selected range depends on the JANUS model. (Refer TECHNICAL DATA - page 31).

RECEIVER SIGNALS

At power-on, for a period of 5 seconds, the display will show the number "8" and all the leds will be ON. In the next 10 seconds, the display and the leds will show the configuration selected. At initial power-on after installation, always check the accuracy of these settings very carefully.

This check is also indispensable in all cases of malfunctioning (ref. "TROUBLESHOOTING").

During display of the configuration, the display will show the letter "C" while during normal functioning, a hyphen "-" will be displayed.

Table 5

In case of fault, only the red led will remain ON and the display will show a flashing "C" or "F" followed by the fault code (ref. TROUBLESHOOTING paragraph).

ELECTRICAL CONNECTIONS AND CONNECTORS

Caution

Before making the electrical connections, always check that the voltage available matches that indicated in the technical data.

The Emitter and Receiver must be powered at 24V_{dc}±20%.

The external power supply must comply with EN 60204.

The electrical connections must be made according to the diagrams provided in this manual.

In particular, never connect other devices to the connectors of the Emitter and Receiver.

To assure dependable functioning, using a diode bridge power supply unit, its output capacity must be at least 2000µF for each Ampere absorbed.

SELECTION OF CONFIGURATION AND OPERATING MODE

The inputs of the JANUS light curtain receiver make it possible to configure various operating modes. At power-on, for correct functioning, the various inputs must be connected as indicated below.

SELECTION FEEDBACK EXTERNAL CONTACTORS K1/K2

Feedback of the external contactors K1/K2 is enabled at system power-on (as indicated in Table 10). If this function is enabled, the set of N.C. contacts of the external relays must be connected to pin 18 of the receiver. The voltage level of this input must be:

- +24VDC with OSSD static outputs de-activated.
- 0VDC with OSSD static outputs activated.

CONTROL OF EXTERNAL CONTACTORS K1/K2	Receiver pins		MEANING
	PIN 11	PIN 18	
	24VDC	0	Control disabled
	0		Control enabled
	0	0	Not permitted
	24VDC	24VDC	Not permitted

Table 10

SELECTION OF MANUAL/AUTOMATIC FUNCTIONING

Manual or automatic operating mode can be set through connection of pins 13 and 14 of the connector of the receiver.

- In AUTOMATIC functioning, the two static outputs OSSD1 and OSSD2 follow the status of the guarded opening. With the area guarded clear, the outputs will supply +24VDC, while with the area occupied they will supply 0VDC. Refer to Table 10 and Table 11 for correct configuration of operating mode.
- In MANUAL functioning, the two static outputs OSSD1 and OSSD2 are active only with the danger area clear and after the light curtain has received a correct RESTART signal. **This command must be sent on pin 14 of the receiver and is active with a 0VDC ---> +24VDC transition.**
- The minimum duration of the RESTART command must be 100ms.

Use of manual mode (start/restart interlock activated) is compulsory if the safety device controls an opening to protect a danger area and a person, after passing through the opening, may remain in the danger area without being detected (use as 'trip device' according to IEC 61496). Failure to comply with this rule may result in very serious hazards for the persons exposed.

The Restart control must be installed outside the danger area in a position where the danger area and the entire work area concerned are clearly visible. It must not be possible to reach the control from inside the danger area.

SELECTION OF MANUAL/AUTOMATIC FUNCTIONING		
CONNECTIONS		
AUTOMATIC		
MANUAL		
	PIN 13	PIN 14
NOT PERMITTED	0	0
	24VDC	24VDC

Table 11

SELECTION OF THE MAXIMUM DURATION AND TYPE OF MUTING

The inputs of the JANUS light curtain receiver make it possible to configure the various types of Muting available and the maximum duration of the Muting condition (timeout).

At power-on, for correct functioning, the various inputs must be connected as indicated below.

Model	Receiver pin		Timeout selected
	10 (CONF3)	9 (CONF2)	
"MT"	0	24VDC	t1
	24VDC	0	t2
"ML"	0	24VDC	t1
"ML S2"	24VDC	0	t2

Table 12 - Models with 2 sensors

where: t1 = 30 sec; t2 = 90 min

NOTE: For the MT (with 2 sensors) and ML models, pin 7 and 8 must not be connected.

Model	Receiver pin				Timeout selected	MEANING
	10 (CONF3)	9 (CONF2)	8 (CONF1)	7 (CONF0)		
"MI" (2 sensors)	0	24VDC	0	0	t1	Concurrent mode (within 4sec)
	24VDC	0	0	0	t2	
"MI" with "L" logic	0	24VDC	24VDC	24VDC	t1	Concurrent mode (within 4sec)
	24VDC	0	24VDC	24VDC	t2	
"MI" (4 sensors)	0	0	0	24VDC	t1	Concurrent mode (within 4sec)
	0	0	24VDC	0	infinite	
"MT S4"	24VDC	24VDC	0	24VDC	t1	Sequential mode
	24VDC	24VDC	24VDC	0	infinite	

Table 13 - Models MI and models MT with 4 sensors

where: t1 = 30 sec; t2 = 90 min

OVERRIDE CONFIGURATION

Receiver pin		MEANING
16 (OVERRIDE1)	17 (OVERRIDE2)	
0	0	Selection override with spring return key
0	24VDC	Selection override with push button (switch)
24VDC	0	Not permitted
24VDC	24VDC	Not permitted

Table 14

MUTING OVERRIDE FUNCTION ("M" MODELS)

The OVERRIDE function must be used when the machine stops due to incorrect Muting activation sequences with the material obstructing the guarded opening.

In this situation, the OSSD outputs are not active as the light curtain and/or at least one Muting sensor is occupied. In this condition the OVERRIDE request led blinks (ref. Table 5).

-  **This function activates the OSSD outputs making it possible to remove the material that is obstructing the opening concerned; moreover the Muting lamp lights on.**
-  **Throughout the entire phase during which the OVERRIDE function is active, the OVERRIDE/MUTING light is ON. Check efficiency of this light periodically (during the Muting or Override phases).**
-  **Warning!! The Override with pulse command automatically activates the outputs of the light curtain until both the light curtain and the muting sensors are free of obstacles again. During this period, the light curtain is unable to protect access to the guarded opening. Therefore, all operations must be carried out under the strict supervision of expert personnel.**

The operator will use the Override mode previously selected (ref. Table 14).

1. Override with continuous action command
2. Override with pulse command

Override with continuous action command

This function is activated driving pins 16 and 17 of the receiver to **+24VDC** at the same time (**maximum delay = 400ms**) using a 2-way key selector with spring return;

PIN 16	PIN 17	CONDITION
0	0	Normal operation
24VDC	24VDC	OVERRIDE request

The maximum override duration is 15 minutes; it can be stopped for two different causes.

- **When the selector is released or if the 15 minutes has been elapsed, override ends**, de-activating the OSSD outputs, turning off the muting lamp and showing normal condition on the display. A new override condition can be started, releasing and rearming the selector.
- **Once the opening has been cleared and the sensors are free again**, override ends and GUARD condition (light curtain in normal operation) is activated without necessity of further commands.

Override with pulse command

This function is activated inverting (**maximum delay = 400ms**) the condition of pin 16 and 17 of the receiver using a push button (switch). During the override the 16 and 17 are not controlled.

PIN 16	PIN 17	CONDITION
0	24VDC	Normal operation
24VDC	0	OVERRIDE request

The override condition can last a maximum of **15 minutes** (repeatable).

The function can only be re-started by pressing the pushbutton again (**subject to the following conditions**) :

1. Maximum total OVERRIDE time (after *n* consecutive requests) = **60 min**
2. Maximum number of consecutive requests for OVERRIDE = **30**.

The override condition ends when the barrier and sensors are cleared (entrance clear) and the GUARD condition is re-enabled (barrier fully operational) without sending any further commands.

The timer (point 1) and counter (point 2) are reset when one of the following conditions occurs:

- A correct muting sequence.
- A system reset (switched off and then turned on).

"SYSTEM STATUS" OUTPUT ("M" MODELS)

A signal that makes it possible to detect 2 separate items of information is available on pin 4 of the receiver:

1. **Weak signal arriving from the Emitter;**
2. **Status of the OSSD outputs.**
 - The output signal will be set to one (24 Vdc) or zero (according to the status of the OSSD) if the weak signal condition is not present
 - The output signal will be at one (24 Vdc) or zero with impulses towards 0 V or towards 24 in weak signal conditions.
 - The conditions of the signal concerned are summarized in the figure below:

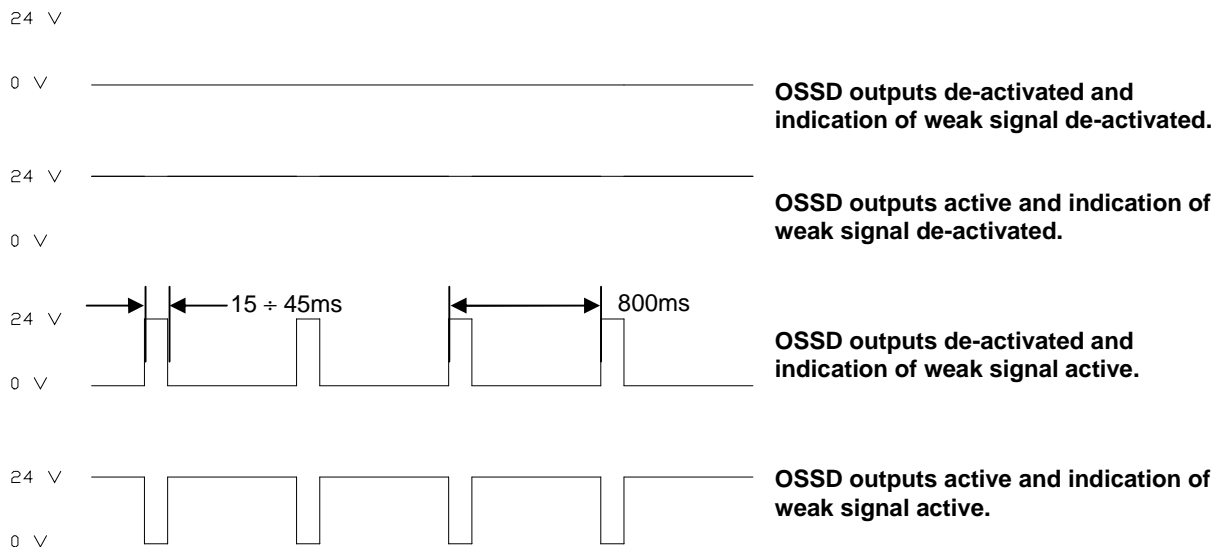

Figure 28

TEST FUNCTION

By means of the test function, which simulates occupation of the protected area, it possible to verify the operation of the entire system by means of an external supervisor (e.g. PLC, control module, etc.). The JANUS barrier system features an automatic self-diagnosis function that enables it to detect response time malfunctions (this time is declared for each model).

This safety system is permanently active and does not require any interventions from the outside. The TEST function is available should the user wish to check equipment connected downstream of the barrier (without physically entering the protected area). By means of this function the OSSDs can be switched from ON to OFF as long as the function remains active. Please see Table 6 for details about the use of the test function.

The minimum duration of the TEST function must be 40 msec.

SAFETY MODULES MJB1 - MJB2 - MJB3 - MJB4

JANUS light curtain can be integrated by the safety modules MJB1 - MJB2 - MJB3 and MJB4.

In fact they contain terminal boards, pre-wired connection, dip switches for the configuration choice and two safety relays connected to the light curtain outputs.

- **MJB1 - MJB3 operates with Janus M (muting)** and has: RESTART push button, key selector for the Muting OVERRIDE, muting function active signaling lamp and two safety relays.
- **MJB2 - MJB4 operates with Janus J (without muting)** and has: RESTART push button and two safety relays.

EXAMPLE OF CONNECTION WITH EXTERNAL CONTACTORS K1/K2 WITH START/RESTART INTERLOCK ACTIVATED

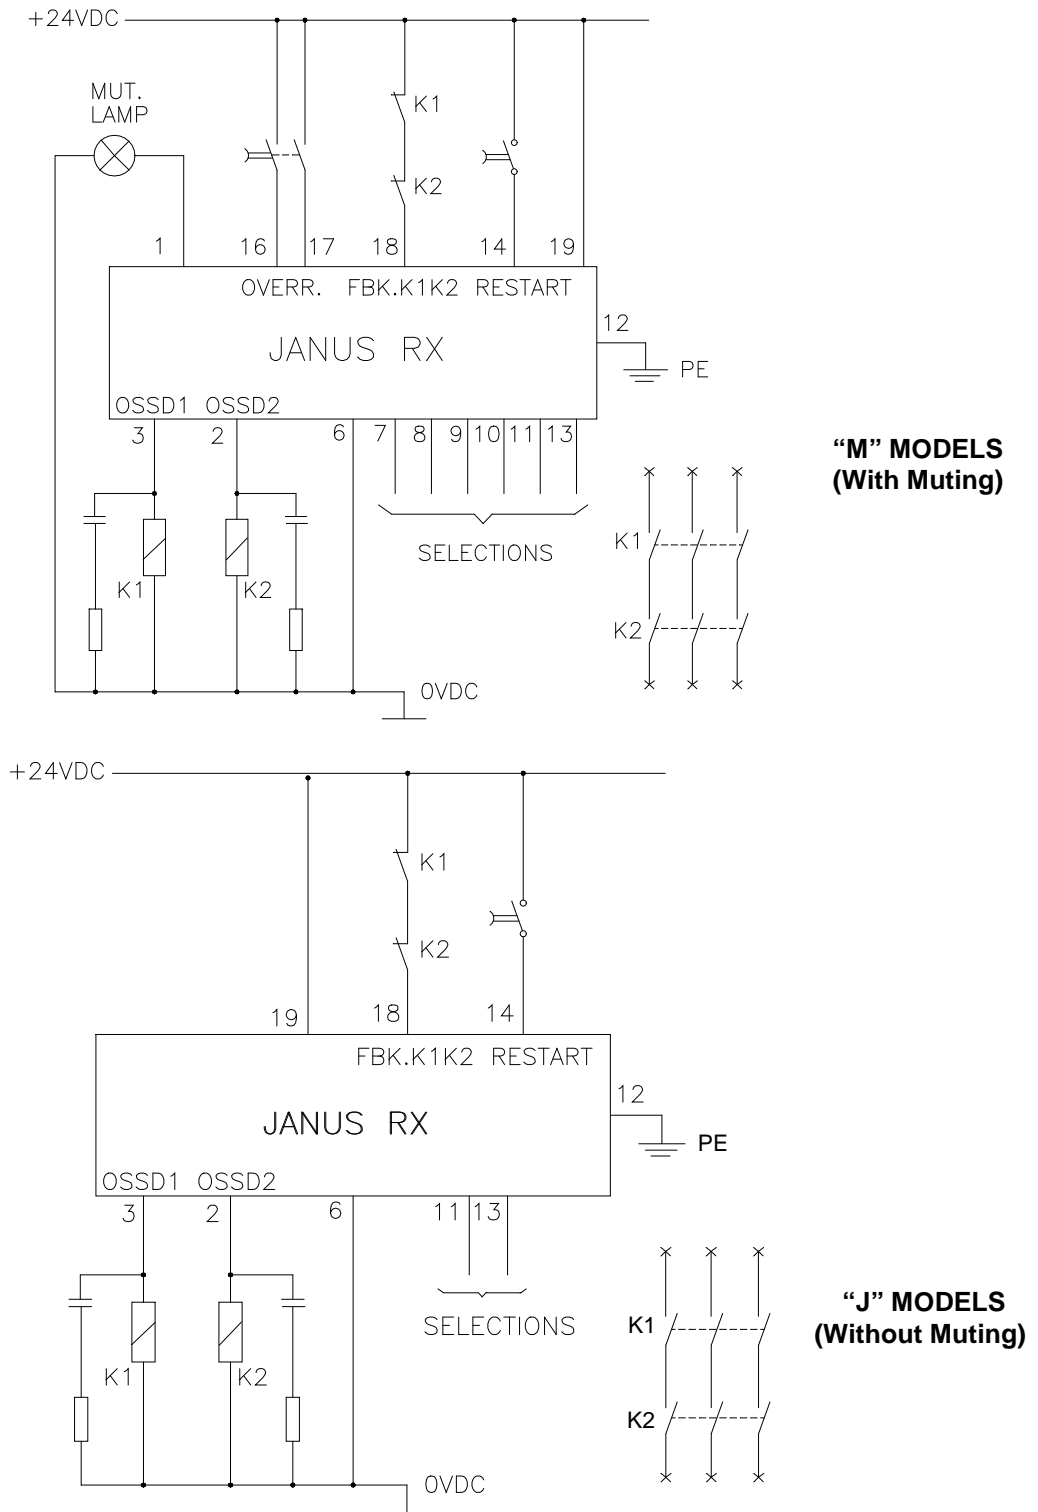

Figura 29

In order to assure a correct barrier operation, it is necessary to connect the pins 2 and 4 of the Emitter according to table 6 (page 20) and to the "TEST FUNCTION" paragraph of page 26. For correct operation (in the case of JANUS "M" without the use of Muting) the muting light must be connected (pin 1) and the Muting mode must be configured correctly (pin 7-8-9-10) following the indications in Table 13.

EXAMPLE OF CONNECTION WITH AD SR0 WITH START/RESTART INTERLOCK ACTIVATED

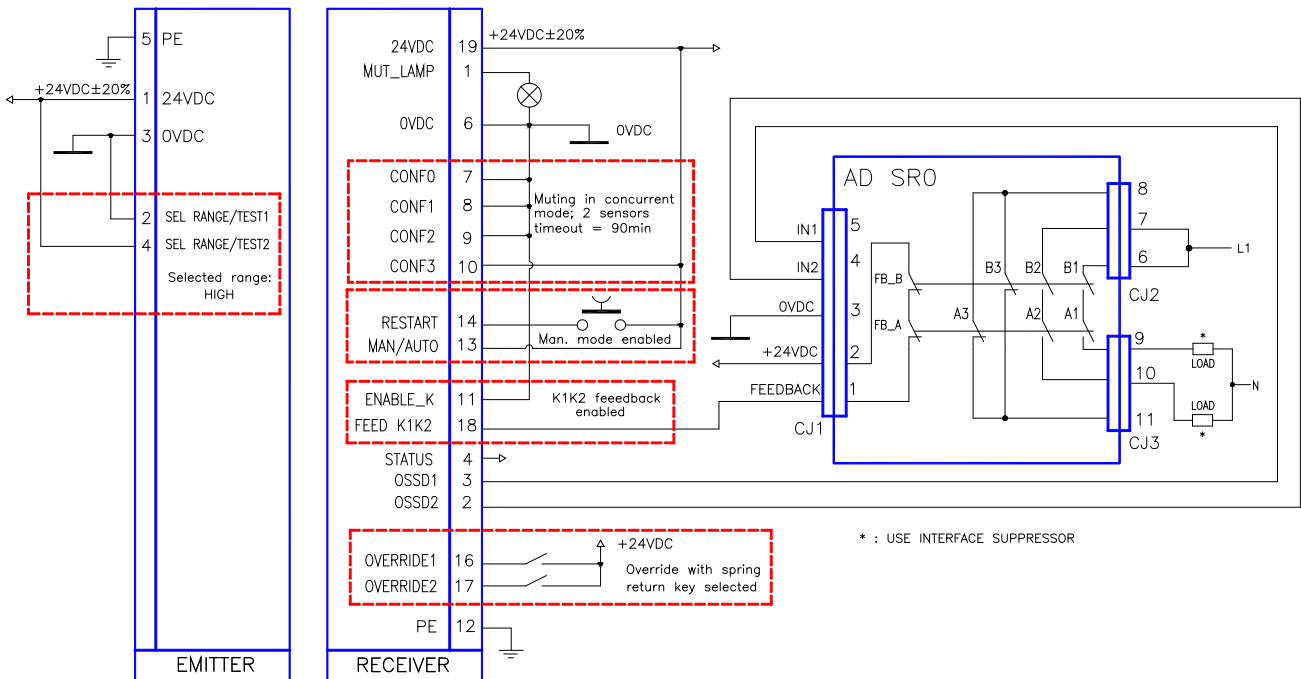

Figura 30

In the protected area clear condition, the Receiver supplies a voltage of 24VDC on both outputs. The required load must therefore be connected between the output terminals and the 0VDC (Figure 31).

Figure 31

MUTING STATUS AND LIGHT ("M" MODELS)

Muting status must be highlighted to the outside using a indicator light close to the guarded opening.

- ➔ JANUS is equipped with an output (pin 1 of connector M23 on the receiver) to which the indicator light can be connected and is able to monitor correct functioning of this and also that it is present.
- ➔ For a JANUS "M" light curtain correct operation the muting lamp must be connected. When using JANUS "M" without Muting function or Muting lamp, connect the receiver pin 1 to 0VDC (via a 10K (1/4 W) resistor). If the muting lamp has a malfunction, the curtain switches to stop status indicating a FAIL on the display of the receiver.

DIMENSIONS

The following tables shows the dimensions of the different JANUS models; refer to the drawings of pages 32÷34.

"J" MODELS									
DIMENSION	16m RANGE			LR

CHECKOUTS AND MAINTENANCE

Verification of barrier efficiency.

Before each work shift or before switching on, check the correct operation of the photoelectric barrier.

Proceed as follows, intercepting the beams using the appropriate test object (available free of charge on request).

The correct test object must be used for testing, depending on the barrier resolution. Please see page 41 for the correct ordering code.

Refer to Figure 38:

- Introduce the test object into the protected area and move it slowly, starting from the top and moving down (or vice versa), first in the centre and then in the vicinity of both the Emitter and the Receiver.
- **Multibeam models:**
Intercept each beam with an opaque object, first in the center of the detection zone and then close to the emitter and the receiver.
- Make sure that during each stage of the test object's movements the red LED on the Receiver is always on.

Figure 38

The JANUS barrier does not require any specific maintenance operations; however, periodic cleaning of the front protective surfaces of the Emitter and Receiver optics is recommended.

Wipe using a clean, damp cloth; in particularly dusty environments, after cleaning the front surface, the use of an anti-static spray is recommended.

Never use abrasive or corrosive products, solvents or alcohol, which could damage parts. Do not use woollen cloths, that could electrify the front surface.

Grooving or fine scratching of the front plastic surfaces can increase the amplitude of the emission angle of the light curtain, jeopardising detection efficiency in the presence of lateral reflecting surfaces.

This issue can also cause interference by muting sensors and jeopardise reliability of the system, also in absence of lateral reflecting surfaces.

It is therefore fundamental to pay particular attention during the cleaning phases of the curtain front window, especially in environments where abrasive dusts are present. (E.g. cement factories, etc).

If the ORANGE weak signal LED on the Receiver switches on (LED 1 in Figure 26), check that:
the front surfaces are clean;
the Emitter and Receiver are aligned correctly.

If the LED stays on, contact the REER service department.

TROUBLESHOOTING

The indications provided on the display of the Receiver make it possible to trace the cause of a system malfunction. As indicated in the “**INDICATIONS**” chapter of this manual, in the case of a fault, the system is blocked and a numeric code identifying the type of fault is shown on the display of the receiver. (See the table below). As soon as the error condition is removed, the code is cleared from the display and the system restarts automatically.

EMITTER

LEDS (Flashing)	DIAGNOSIS	REMEDY
Red	Internal fault	Send the equipment for repair to the REER laboratories.
Red + Yellow	Internal fault	Send the equipment for repair to the REER laboratories.
Red + Green	Internal fault	Send the equipment for repair to the REER laboratories.
Red + Orange	Range selection error	Correct the range selection on the Emitter Unit

RECEIVER

CODE (Flashing)	DIAGNOSIS	REMEDY	
F	Displayed alternatively to the error code		
CONFIGURATION ERRORS	C	Incorrect configuration of the system (the flashing led together with the C indicates the incorrect type of configuration) (ref. Table 4)	Check the connections according to configuration selected
	* L	Muting light not present or fault	Check that the MUTING lamp is present and working efficiently
	U	Incorrect "SYSTEM STATUS" or overload signal connection	Check the connection of terminal 4.
	2	OSSD outputs incorrectly connected to +24VDC	Carefully check the connection of terminals 2 and 3 (OSSD) on the connector. Warning : the load must be positioned between the MUTING function (OSSD) and 0 Vdc.
	E	External contact enabling/disabling signal missing or contactors feedback missing	Check the connections of terminals 11 and 18.
	H	Incorrect initial OVERRIDE configuration	Check the connections of terminals 16 and 17.
	* II	<ul style="list-style-type: none"> Unstable Muting sensors signals Barrier configured for 2 sensors but found 3 or 4 sensors (the correspondent led flashes) 	<ul style="list-style-type: none"> Check positioning of the muting sensors Verify the number of the sensors connected and the selected configuration
FAULTS	3	Internal error	Send the equipment for repair to the REER laboratories.
	4	Internal error	Send the equipment for repair to the REER laboratories.
	5	Internal error on the OSSD outputs (or incorrect connection of these)	Carefully check the connection of terminals 2 and 3 (OSSD) on the connector. These terminals could be connected directly to + 24 Vdc or 0 Vdc. Otherwise, send the equipment for repair to the REER laboratories.
	A	Internal error	Send the equipment for repair to the REER laboratories.

* Specifications applicable only to models with Muting function

CODE (Not flashing)	DIAGNOSIS	REMEDY
6	Short-circuit between the OSSD outputs	Carefully check the connection of terminals 2 and 3.
0	Overload of the OSSD outputs	Carefully check the connection of terminals 2 and 3 (OSSD) on the connector. If necessary, adjust load reducing the current required to max 500 mA (2.2 μ F)
1	Interfering Emitter detected (THE CODE REMAINS VISIBLE FOR AL LEAST 30s)	Carefully locate the interfering Emitter and take action in one of the following ways: <ul style="list-style-type: none"> • Switch the position of the Emitter and Receiver • Move the interfering Emitter to avoid this illuminating the Receiver • Shield the beams coming from the interfering Emitter using opaque protections
t (flashing)	Override with pulse command expired	Reset the system

GUARANTEE

All new JANUS systems are guaranteed by REER for a period of 12 (twelve) months under normal working conditions, against defects due to faulty materials and workmanship.

During the aforesaid period, REER promises to replace faulty parts free of charge. This guarantee covers both material and labour.

REER reserves the right to decide whether to repair equipment or replace it with equipment of the same type or having the same characteristics.

The validity of this guarantee is subject to the following conditions:

- The user must notify REER of the fault within twelve months following the date of delivery of the product.
- The equipment and all parts thereof must be in the condition in which they were supplied by REER.
- The defect or malfunction must not arise directly or indirectly from:

Improper use

Non-observance of the instructions for use;

Negligence, inexperience, improper maintenance;

Repairs, modifications and adjustments carried out by personnel not authorised by REER, tampering, etc.;

Accidents or collisions (also during transportation or due to acts of God);

Other reasons for which REER cannot be held responsible.

Repairs will be carried out at REER's laboratories, to which the material must be consigned or forwarded: transport costs and any damage or loss of material during transportation will be charged to the Customer.

All replaced products and parts are property of REER.

REER does not recognise any other form of guarantee or rights other than those expressly stated above; no requests for compensation for damages incurred for costs, suspension of activities or any other events or circumstances related in any way to malfunctioning of the product or any parts thereof will be taken into consideration.

*In order to ensure the correct operation of the photoelectric barrier, careful and full compliance with all the rules, instructions and warnings stated in this manual is essential.
REER s.p.a. declines all responsibility for events arising from non-compliance with all or part of the aforesaid instructions.*

Specifications subject to change without warning. ¶ No part of this manual may be reproduced without the prior consent of REER.
